

Roast Your Beans. *Improve Your Feed.*

The SoyRoaster utilizes a concept that constantly and continuously produces evenly roasted and ground beans for dairy feed. Powered by electricity, the roaster heats oil inside a heating chamber to roast beans.

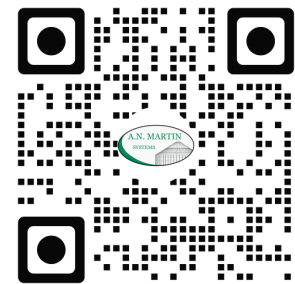

The beans are cooked for 30 minutes, then enter a cooling hopper and continue to steep for an additional 15 minutes. The beans are then augered into a 24" Hammermill, where they are ground to the desired feed component. Finally, the beans are blown through a blower to your feed holding bin or storage unit!

The SoyRoaster has the capacity to roast up to 10,000 lbs. of product in a 24-hour period. With a custom designed control panel, it runs completely automatic to produce the right soy product for your farm operation!

- Pre-Assembled In A Shipping Container For Easy installation
- Ideal For Individual Farm Operation
- Completely automatic (monitor it from your phone)
- Plug & Play Operation
- Powered by electricity
- Adjustable temperature control
